

# An Embodiment of Quasi-Symmetric Functions: the Hurwitz Multizeta Functions.

Olivier Bouillot,  
Marnes la Vallée University, France

70<sup>th</sup> Séminaire Lotharingien de Combinatoire, Ellwangen,  
Monday 25<sup>th</sup> March 2013 .

**Definition:** Hurwitz multizeta functions.

Let  $\mathcal{S}_+^* = \{\underline{s} = (s_1, \dots, s_r) \in \mathbb{N}_1^*; r \in \mathbb{N} \text{ and } s_1 \geq 2\}$ .

For all  $\underline{s} \in \mathcal{S}_+^*$ :

$$\mathcal{H}e_+^{s_1, \dots, s_r}(z) = \sum_{0 < n_r < \dots < n_1} \frac{1}{(n_1 + z)^{s_1} \dots (n_r + z)^{s_r}} .$$

**Aim:** Studying the algebra  $\mathcal{HMZF}_+ = \text{Vect}_{\mathbb{Q}}(\mathcal{H}e_+^{\underline{s}})_{\underline{s} \in \mathcal{S}_+^*}$ .

**Theorem:**

- 1 The family  $(\mathcal{H}e_+^{\underline{s}})_{\underline{s} \in \mathcal{S}_+^*}$  is  $\mathbb{C}(z)$ -free.
- 2  $\mathcal{HMZF}_+ \simeq \mathbb{Q}\langle \mathcal{L}(y_1; y_2; \dots) - \{y_1\} \rangle$ .

**1** A Fundamental Property

**2** A Lemma of Rational Fractions and 1-Periodic Functions

**3** Proof of the Key Point

# 1. A Fundamental Property: Definitions and Notations

- **Hurwitz multizeta functions.**

$$\mathcal{H}e_+^{s_1, \dots, s_r} : z \mapsto \sum_{0 < n_r < \dots < n_1} \frac{1}{(n_1 + z)^{s_1} \dots (n_r + z)^{s_r}}, \text{ for all } (s_1, \dots, s_r) \in \mathcal{S}_+^* .$$

$$\mathcal{H}e_+^1 : z \mapsto \sum_{n_1 > 0} \left( \frac{1}{n_1 + z} - \frac{1}{n_1} \right) .$$

- **The shift operator.**

$$\tau^{-1}(f)(z) = f(z - 1) .$$

- **A difference operator.**

$$\Delta_-(f)(z) = f(z - 1) - f(z) .$$

- **Some auxiliary functions.** For all  $(s_1, \dots, s_r) \in \mathbb{N}_1^*$ :

$$J^{s_1, \dots, s_r}(z) = \begin{cases} \frac{1}{z^{s_1}} & , \text{ if } r = 1 . \\ 0 & , \text{ otherwise } . \end{cases}$$

# 1. A Fundamental Property - Statement and proof

## Fundamental Property:

For all sequences  $\underline{s} = (s_1, \dots, s_r) \in \mathcal{S}_+^*$ , we have:

$$\Delta_-(\mathcal{H}e_+^{s_1, \dots, s_r}) = \mathcal{H}e_+^{s_1, \dots, s_{r-1}} \cdot J^{s_r}.$$

## Sketch of proof:

$$\begin{aligned}\mathcal{H}e_+^{\underline{s}}(z-1) &= \sum_{0 < n_r < \dots < n_1} \frac{1}{(n_1 + z - 1)^{s_1} \dots (n_r + z - 1)^{s_r}} \\&= \sum_{-1 < n_r < \dots < n_1} \frac{1}{(n_1 + z)^{s_1} \dots (n_r + z)^{s_r}} \\&= \sum_{0 < n_r < \dots < n_1} \frac{1}{(n_1 + z)^{s_1} \dots (n_r + z)^{s_r}} + \sum_{0 = n_r < \dots < n_1} \frac{1}{(n_1 + z)^{s_1} \dots (n_r + z)^{s_r}} \\&= \mathcal{H}e_+^{\underline{s}}(z) + \mathcal{H}e_+^{s_1, \dots, s_{r-1}}(z) \cdot \frac{1}{z^{s_r}}.\end{aligned}$$

# 1. A Fundamental Property - Statements of corollaries

Corollary A:

Each Hurwitz multizeta function is a resurgent function.

Corollary B: the key point.

The family  $(\mathcal{H}e_+^{\mathbf{s}})_{\mathbf{s} \in \mathcal{S}_+^*}$  is  $\mathbb{C}(z)$ -free.

Both of these are not trivial consequences...

$\Rightarrow$  For the safety of the audience, we will focus ourself only on the second one.

## 2. A lemma of rational fractions and 1-periodic functions

### Lemma:

Let  $F$  be a rational fraction and  $f$  a 1-periodic function.

If, for an  $n$ -tuple  $(\lambda_1, \dots, \lambda_n) \in \mathbb{C}^n$ , the equality  $F + \sum_{i=1}^n \lambda_i \mathcal{H}e_+^i = f$  is a valid one, then we necessarily have:

$$\begin{cases} \lambda_1 = \dots = \lambda_n = 0 . \\ F \text{ and } f \text{ are constant functions .} \end{cases}$$

### Sketch of proof:

$$\begin{aligned} \bullet \quad \sum_{i=1}^n \lambda_i \mathcal{H}e_+^i \neq 0 &\implies \exists N \in \mathbb{N}, +N, -N \notin \text{poles}(F) \\ &\implies -N \in \text{poles}(f) \implies \mathbb{Z} \subset \text{poles}(f) \\ &\implies +N \in \text{poles}(f) \implies +N \in \text{poles}(F) \\ &\implies \text{Contradiction.} \end{aligned}$$

$$\bullet \quad \begin{cases} \sum_{i=1}^n \lambda_i \mathcal{H}e_+^i = 0 \implies \lambda_1 = \dots = \lambda_n = 0 . \\ F = f = \text{constant functions.} \end{cases}$$

### 3. Proof of the Key Point: Notations

#### ■ Definition of an order in $\mathcal{S}_+^*$ :

Definition:  $d^\circ(s_1, \dots, s_r) = s_1 + \dots + s_r - r$ .

Notation: For all  $d \in \mathbb{N}$ :

$$\begin{cases} \mathcal{S}_{\leq d}^* &= \{\underline{s} \in \mathcal{S}^* ; d^\circ \underline{s} \leq d\} \\ \mathcal{S}_d^* &= \{\underline{s} \in \mathcal{S}^* ; d^\circ \underline{s} = d\} \end{cases}$$

Order  $<$ : degree  $1 < \text{degree } 2 < \text{degree } 3 < \dots$ .

For all  $d \in \mathbb{N}^*$ , inside  $\mathcal{S}_d^*$ : length  $1 < \text{length } 2 < \text{length } 3 < \dots$ .

Notation:  $\mathcal{S}_{d+1}^* = \{\underline{s}^n ; n \in \mathbb{N}^*\}$ .

For all  $n \in \mathbb{N}$ ,  $S_n = \{\underline{s}^i ; 1 \leq i \leq n\}$ .

#### ■ Double induction process:

$\mathcal{P}_{d,n}$ : "the family  $(\mathcal{H}e_+^{\underline{s}})_{\underline{s} \in \mathcal{S}_{\leq d}^*} \bigcup (\mathcal{H}e^{\underline{s}})_{\underline{s} \in S_n}$  is  $\mathbb{C}(z)$ -free."

### 3. Proof of the Key Point: Example to picture the proof 1/3

- Let us suppose that:

$$F_2 He_+^2 + F_3 He_+^3 + F_{2,1} He_+^{2,1} + F_4 He_+^4 = G$$
$$\Downarrow$$
$$F_2 = F_3 = F_{2,1} = F_4 = G = 0 .$$

- Let us consider the relation:

$$F_2 He_+^2 + F_3 He_+^3 + F_{2,1} He_+^{2,1} + F_4 He_+^4 + F_{3,1} He_+^{3,1} = G ,$$

where  $F_2$  ,  $F_3$  ,  $F_{2,1}$  ,  $F_4$  ,  $F_{3,1}$  and  $G$  are rational fractions.

**Aim:**  $F_2 = F_3 = F_{2,1} = F_4 = F_{3,1} = G = 0$  .

**Main idea:** Proving by contradiction that  $F_{3,1} = 0$  .

**Remark:** If  $F_{3,1} \neq 0$ , we can suppose that  $F_{3,1} = 1$  .

### 3. Proof of the Key Point: Example to picture the proof 2/3

#### Reminder:

$$F_2 \mathcal{H}e_+^2 + F_3 \mathcal{H}e_+^3 + F_{2,1} \mathcal{H}e_+^{2,1} + F_4 \mathcal{H}e_+^4 + \mathcal{H}e_+^{3,1} = G ,$$

- Applying  $\Delta_-$  to this equality:

$$\begin{aligned} & \left( \Delta_-(F_2) \mathcal{H}e_+^2 + \tau^{-1}(F_2) \cdot J^2 \right) + \left( \Delta_-(F_3) \mathcal{H}e_+^3 + \tau^{-1}(F_3) \cdot J^3 \right) \\ + & \left( \Delta_-(F_{2,1}) \mathcal{H}e_+^{2,1} + \tau^{-1}(F_{2,1}) \mathcal{H}e_+^2 \cdot J^1 \right) + \left( \Delta_-(F_4) \mathcal{H}e_+^4 + \tau^{-1}(F_4) \cdot J^4 \right) \\ + & \mathcal{H}e_+^3 \cdot J^1 = \Delta_-(G) . \end{aligned}$$

- Using the hypothesis:

$$\left\{ \begin{array}{l} \Delta_-(F_2) + \tau^{-1}(F_{2,1}) \cdot J^1 = 0 . \\ \Delta_-(F_3) + J^1 = 0 . \\ \Delta_-(F_{2,1}) = 0 . \\ \Delta_-(F_4) = 0 . \\ \Delta_-(G) = \sum_{k=2}^4 \tau^{-1}(F_k) \cdot J^k . \end{array} \right.$$

#### Reminder:

### 3. Proof of the Key Point: Example to picture the proof 3/3

■ Contradiction:

$$\begin{aligned}\Delta_-(F_3) + J^1 = 0 &\implies \Delta_-(F_3 + \mathcal{H}e_+^1) = 0 \\ &\implies F_3 + \mathcal{H}e_+^1 = 1 - \text{periodic function} \\ &\implies 1 = 0, \text{ because of the last lemma !!!}\end{aligned}$$

■ So,  $F_{3,1} = 0$  .

The hypothesis implies now:

$$F_2 = F_3 = F_{2,1} = F_4 = F_{3,1} = G = 0 .$$

### 3. Proof of the Key Point: Proof 1/5

Reminder:  $S_{d+1}^* = \{\underline{s}^n ; n \in \mathbb{N}^*\}$  .

For all  $n \in \mathbb{N}$ ,  $S_n = \{\underline{s}^i ; 1 \leq i \leq n\}$  .

- Let us consider the following properties:

$\mathcal{D}_d$  : “the family  $(\mathcal{H}e^{\underline{s}})_{\underline{s} \in S_{\leq d}^*}$  is  $\mathbb{C}(z)$ -free.”

$\mathcal{P}_{d,n}$  : “the family  $(\mathcal{H}e^{\underline{s}})_{\underline{s} \in S_{\leq d}^*} \cup (\mathcal{H}e^{\underline{s}})_{\underline{s} \in S_n}$  is  $\mathbb{C}(z)$ -free.”

- Aim:  $\forall d \in \mathbb{N}, \mathcal{P}_{d,n} \implies \mathcal{P}_{d,n+1}$  ,

because:

$$\left\{ \begin{array}{l} \mathcal{D}_0 \text{ is true.} \\ \mathcal{D}_{d+1} \text{ is true} \iff \forall n \in \mathbb{N}, \mathcal{P}_{d,n} \text{ is true.} \end{array} \right.$$

### 3. Proof of the Key Point: Proof 2/5

Let us consider:

$$\sum_{\substack{\underline{s} \in S_{\leq d}^* \cup S_{n+1} \\ \underline{s} \neq \emptyset}} F_{\underline{s}} \cdot \mathcal{H}e^{\underline{s}} = F ,$$

where  $F$  and  $F_{\underline{s}}$  ,  $\underline{s} \in S_{\leq d}^* \cup S_{n+1}$  , are rational fractions.

**Aim:** Proving that  $F_{\underline{s}^{n+1}} = 0$ , by contradiction.

Let us denote  $\underline{s}^{n+1} = \underline{u} \cdot p$ , where  $\begin{cases} p \geq 1 . \\ \underline{u} \in S_{\leq d+2-p}^* . \end{cases}$

If  $F_{\underline{s}^{n+1}} \neq 0$ , we can suppose  $F_{\underline{s}^{n+1}} = 1$  .

#### ■ Step 1: writing the system.

$$\begin{cases} \forall \underline{s} \in (S_{\leq d}^* \cup S_n) - \{\emptyset\} , \Delta_{-}(F_{\underline{s}}) + \sum_{\substack{k \in \mathbb{N}^* \\ \underline{s} \cdot k \in S_{\leq d}^* \cup S_n}} \tau^{-1}(F_{\underline{s} \cdot k}) \cdot J^k = 0 . \\ \Delta_{-}(F) = \sum_{k=2}^{d+1} \tau^{-1}(F_k) J^k + (1 - \delta_{n,0}) \tau^{-1}(F_{d+2}) J^{d+2} . \end{cases}$$

### 3. Proof of the Key Point: Proof 3/5

#### ■ Step 2: solving partially the system.

##### Lemma:

Let  $r$  be a positive integer and  $p \geq 2$ .

Let us also consider two  $r$ -tuples,  $(n_1, \dots, n_r) \in \mathbb{N}^r$  and  $(k_1, \dots, k_r) \in (\mathbb{N}_{\geq 2})^r$

such that  $\sum_{i=1}^r (k_i - 1) \leq p - 2$ .

Then,  $F_{\underline{u} \cdot k_1 \cdot 1^{[n_1]} \dots k_r \cdot 1^{[n_r]}} = \begin{cases} 0 & , \text{ if } n_r > 0 . \\ \text{cste} & , \text{ if } n_r = 0 . \end{cases}$

##### Sketch of proof:

Let  $\delta = p - 2 - \sum_{i=1}^r (k_i - 1)$  ; let us suppose here that  $\delta = 0$  !!!!

Applied to  $\underline{v} \cdot 1^{[n]}$ ,  $n \in \mathbb{N}$ , where  $\underline{v} = \underline{u} \cdot k_1 \cdot 1^{[n_1]} \dots k_r$ , the system gives us:

$$\forall n \in \mathbb{N} , \Delta_- \left( F_{\underline{v} \cdot 1^{[n]}} \right) + \tau^{-1} \left( F_{\underline{v} \cdot 1^{[n+1]}} \right) J^1 = 0 .$$

### 3. Proof of the Key Point: Proof 4/5

$$\forall n \in \mathbb{N}, \Delta_- \left( F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n]}} \right) + \tau^{-1} \left( F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n+1]}} \right) J^1 = 0. \quad (1)$$

$$\begin{aligned} \exists n_0 \in \mathbb{N}, F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0]}} = 0 &\implies \Delta_- \left( F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} \right) = 0, \text{ by (1)} \\ &\implies F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} \text{ is a 1-periodic function :} \\ &\implies F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} \text{ is a constant function :} \\ &\quad F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} = f_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} \in \mathbb{C} \\ &\implies \Delta_- \left( F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-2]}} + f_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} \mathcal{H}e^1 \right) = 0, \text{ by (1)} \\ &\implies F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-2]}} + f_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} \mathcal{H}e^1 \text{ is a 1-periodic function} \\ &\implies \begin{cases} F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} = f_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-1]}} = 0 \\ F_{\underline{\mathbf{v}} \cdot \mathbf{1}^{[n_0-2]}} \text{ is a constant function} \end{cases} \\ &\implies \text{and so on.} \end{aligned}$$

Consequence:

$$F_{\underline{\mathbf{u}} \cdot \mathbf{k}_1 \cdot \mathbf{1}^{[n_1]} \dots \mathbf{k}_r \cdot \mathbf{1}^{[n_r]}} = \begin{cases} 0, & \text{si } n_r > 0. \\ \text{cste}, & \text{si } n_r = 0. \end{cases}$$

### 3. Proof of the Key Point: Proof 5/5

#### ■ Step 3: Highlighting of the contradiction.

We have:

$$\begin{cases} \Delta_-(F_{\underline{u}}) + \sum_{k=1}^{p-1} \tau^{-1}(F_{\underline{u} \cdot k}) J^k + J^p = 0 . \\ \forall k \in \llbracket 1 ; p-1 \rrbracket , F_{\underline{u} \cdot p-1} = f_{\underline{u} \cdot p-1} \in \mathbb{C} . \end{cases}$$

From

$$\Delta_- \left( F_{\underline{u}} + \sum_{k=1}^{p-1} f_{\underline{u} \cdot k} \mathcal{H}e^k + \mathcal{H}e^p \right) = 0 ,$$

we deduce:

$$F_{\underline{u}} + \sum_{k=1}^{p-1} f_{\underline{u} \cdot k} \mathcal{H}e^k + \mathbf{1} \cdot \mathcal{H}e^p \text{ defines a 1-periodic function.}$$

This contradicts the lemma. Thus,  $F_{\underline{s}^{n+1}} = 0$  and the induction hypothesis gives the conclusion. □

We have proved:

## Theorem:

- 1 The family  $(\mathcal{H}e_+^{\underline{s}})_{\underline{s} \in \mathcal{S}_+^*}$  is  $\mathbb{C}(z)$ -free.
- 2  $\mathcal{H}MZF_+ \simeq \mathbb{Q}\langle \mathcal{L}(y_1; y_2; \dots) - \{y_1\} \rangle$ .

## Consequence:

The algebra spanned by the Hurwitz multizeta functions is an embodiment of  $QSym$ .

**THANK YOU FOR YOUR ATTENTION !**
